Cosmetic Formulations

The present invention relates to cosmetic formulations comprising at least one pigment with an intense and saturated colour, more especially, to compositions for making up the skin, both of the face and of the human body, keratinous fibers or superficial body growths, such 5 as the nails, eyelashes, eyebrows or hair, and the lips.

Makeup compositions, such as free or compacted powders, foundations, face powders, eyeshadows, lipsticks, products for concealing rings under the eyes, blushers, mascaras, 10 liners, lip pencils, eyeliner pencils, nail varnishes and products for making up the body are composed of an appropriate vehicle and of colouring agents of different natures intended to confer a certain colour on these compositions before and/or after their application to the skin, lips and/or superficial body growths.

These colouring agents can be lakes, inorganic or organic pigments and/or pearlescent 15 pigments or alternatively colorants. Cosmetic scientists have available pigments of inorganic origin, such as iron oxides or mixtures of brown-yellow iron oxides, and pigments of organic origin. Inorganic pigments, in particular inorganic oxides, have the advantage of being very stable but have the disadvantage of giving rather drab and pale colours. Organic lakes have 20 the advantage of conferring more saturated colours on the compositions but the majority is unstable with respect to light, temperature or pH. Some of these lakes also exhibit the disadvantage of staining the skin in an unsightly way after application, by escape of the colorant. Pearlescent pigments, for their part, make it possible to obtain varied but never intense colours with effects which are iridescent but which are generally fairly weak.

25 Therefore, there is still a need for further formulations having improved colour strength and saturated shades which, in addition to good tolerability, additionally exhibit outstanding fastness properties in as many areas as possible.

It has now been found that the formulations according to the invention meet those 30 requirements.

By virtue of the pigments used according to the invention in the novel formulations, it is possible to obtain colour shades that hitherto were difficult to achieve or could not be

achieved at all. The new pigment formulations have outstanding pigmentary properties, such as lightfastness, chroma/saturation, colour strength, hiding power and dispersibility. Further, the colour is almost identical with the colour that can be achieved on the skin and nails using the novel formulations. As a result it is very readily possible to achieve precisely the desired  
5 colour shade. The novel formulations are distinguished especially by the fact that they exhibit no "bleeding" of the pigments into the skin and the nails, that is to say sharp outlines are obtained therewith on the skin and the nails themselves are not stained.

An embodiment of the invention is a cosmetic formulation comprising at least one pigment of  
10 formula (I)

20

The pigment of the invention may be transparent or opaque and can be a physical mixture or a solid solution or a mixed crystal of two or more pigments of the formula (I) or of pigments of the formula (I) with one or more of other organic pigments. The pigment of the invention may optionally be combined with other pigments for shifting the colour of the formulation or for enhancing the color power and/or goniochromatic properties of crystal liquid or multilayer pigments having goniochromatic properties.

25

The manufacture of the diketodiarylpyrrolo-pyrroles of formula (I) is disclosed in particular in the Ciba-Geigy documents EP-A-94,911, EP-A-542,669, EP-A-787,730, EP-A-787,731 and WO-A-96/08537. The specific surface area (BET) and the average primary particle size can be controlled by commonly known methods, such as growth inhibitors acid pasting, basic reprecipitation, mechanical methods, for example dry (salt) grinding (or milling), kneading, wet milling etc.

The pigment according to the invention may be incorporated in a cosmetic formulation, in an amount which can be easily determined by a person skilled in the art on the basis of his broad knowledge and which can in particular range from 0.01 to 50% by weight with respect to the weight of the formulation, preferably in an amount ranging from 0.5 to 25% by weight.

- 5 This pigment can be also fixed on a polymer in particular by graphing or embedding. Moreover, it is also possible to use one or more pigments of formula (1) together with other pigments, goniochromatic pigments and/or colourants such as are employed in cosmetic formulations. Pigments other than those of formula (I) may be present in the formulation in an amount ranging from 0 to 25% of the weight of the final formulation and preferably from 2 to
- 10 15%. Preferred inorganic pigments are, for example, titanium, zirconium or cerium oxides, as well as zinc, iron or chromium oxides and ferric blue. Preferred organic pigments are, for example, carbon black and barium, strontium, calcium and aluminium lakes. Further suitable pigments are those described in EP408498, EP953343 or WO0033795.
- 15 If desired, the pigments may also be used in the form of surface-modified pigments, for example modified by perfluoroalkyl phosphate, methylpolysiloxanes, methyl-hydrogen-poly-siloxanes or chitosan. Suitable modified pigments are, for example, those described by B. G. Hays in Am. Inkmaker, (June, 1984) 28, (Oct., 1986) 13 and (Nov., 1990) 28.
- 20 In addition, it is also possible to use solid solutions of the pyrrolo-[3,4-c]-pyrroles, for example solid solutions consisting of two different compounds of that type, such as are described in US Patent Specification 4 783 540, or solid solutions of pyrrolo-[3,4-c]-pyrroles and quinacridones, such as are described in US Patent Specification 4 810 304, or solid solutions consisting of two different pyrrolo-[3,4-c]-pyrroles and quinacridones, such as are described
- 25 in US Patent Specification 5 529 623.

Such optionally modified pigments are advantageously used in the form of pigment preparations in which the pigment is already in dispersed form. Suitable preparations are described, for example, in W. Herbst, K. Hunger: Industrielle organische Pigmente, VCH Verlags-gesellschaft 1995, page 92 ff.

Therefore, a further embodiment of the present invention relates to a cosmetical formulation comprising, based on the total weight of the formulation,

- a) from 0.0001 to 50 %, preferably from 0.0001 to 25 %, of at least one pigment of formula (I), and
- b) from 50 to 99.9999 %, preferably from 0.0001 to 20 %, of a cosmetically suitable carrier.

5

The pigments according to the present invention can have a broad range of primary particle size. The average primary particle size of the pigments depends on their use. The primary particle size is defined as the length of the longest dimension and it is estimated by the analysis of the transmission electron microscopy.

- 10 The pigments according to the present invention used in cosmetic preparations and formulations have preferably an average primary particle size of 0.1 – 1 $\mu$ m. For certain uses the average primary size of the pigments can be up to 2.0 $\mu$ m. For other uses, the average primary size of the pigments can be even smaller than 0.1 $\mu$ m. More preferably the average primary size of the pigments according to the present invention have an average primary particle size < 0.2 $\mu$ m and > 0.01 $\mu$ m, preferably > 0.015  $\mu$ m, even more preferably >0.02 $\mu$ m.
- 15 Especially preferably, the pigments according to the present invention have an average primary particle size < 0.1 $\mu$ m and > 0.01 $\mu$ m, preferably > 0.015  $\mu$ m, even more preferably >0.02 $\mu$ m.
- 20 The pigments according to the present invention used in cosmetic preparations and formulations have preferably a specific surface area (BET) of 6 – 200m<sup>2</sup>/g. Preferably, the pigments have a specific surface area (BET) of 8 – 170 m<sup>2</sup>/g, even more preferred of 10 – 150 m<sup>2</sup>/g.

- 25 The specific surface area (BET) is measured according to the method developed by Brunauer, Emmet and Teller. The standardized method is described in DIN 66131 and DIN 66132.

- 30 Suitable carriers for the cosmetic preparations and formulations according to the invention are the conventional materials used in such compositions.

The cosmetic preparations and formulations according to the invention may be in the form of, for example, sticks, ointments, creams, emulsions, suspensions, dispersions, powders or

solutions. They are, for example, lipsticks, mascara preparations, make-up for the cheeks, eyeshadows, foundations, eyeliners, powders or nail varnishes.

When the preparations are in the form of sticks, for example lipsticks, eyeshadows, make-up

- 5 for the cheeks or foundations, such preparations consist for a considerable part of fatty components, which may consist of one or more waxes, for example ozocerite, lanolin, lanolin alcohol, hydrogenated lanolin, acetylated lanolin, lanolin wax, beeswax, candelilla wax, microcrystalline wax, carnauba wax, cetyl alcohol, stearyl alcohol, cocoa butter, lanolin fatty acids, petrolatum, petroleum jelly, mono-, di- or tri-glycerides or -fatty esters that are solid at
- 10 25°C, silicone waxes, such as methyloctadecane-oxypolysiloxane and poly(dimethylsiloxy)-stearoxysiloxane, stearic acid monoethanolamine, colophane and derivatives thereof, such as glycol abietates and glycerol abietates, hydrogenated oils that are solid at 25°C, sugar glycerides and oleates, myristates, lanolates, stearates and dihydroxy stearates of calcium, magnesium, zirconium and aluminium.

15

The fatty component may also consist of a mixture of at least one wax and at least one oil, in which case the following oils, for example, come into consideration: paraffin oil, purcellin oil, perhydrosqualene, sweet almond oil, avocado oil, calophyllum oil, castor oil, sesame oil, jojoba oil, mineral oils having a boiling point of approximately from 310 to 410°C, silicone oils, such as dimethylpolysiloxane, linoleic alcohol, linolenic alcohol, oleyl alcohol, cereal grain oils, such as wheatgerm oil, isopropyl lanolate, isopropyl palmitate, isopropyl myristate, butyl myristate, cetyl myristate, hexadecyl stearate, butyl stearate, decyl oleate, acetyl glycerides, octanoates and decanoates of alcohols and polyalcohols, for example of glycol and glycerol, ricinoleates of alcohols and polyalcohols, for example of cetyl alcohol, isostearyl alcohol, isocetyl lanolate, isopropyl adipate, hexyl laurate and octyldodecanol.

The fatty components in such preparations in the form of sticks may generally account for up to 99.9 % by weight of the total weight of the preparation.

- 30 The cosmetic preparations and formulations according to the invention may additionally comprise further constituents, for example glycols, polyethylene glycols, polypropylene glycols, monoalkanolamides, undyed polymeric, inorganic or organic fillers, preservatives, UV filters or other adjuvants and additives conventionally employed in cosmetics.

Such further constituents are, for example, a natural or a synthetic or a semi-synthetic di- or tri-glyceride, a mineral oil, a silicone oil, a wax, a fatty alcohol, a Guerbet alcohol or an ester thereof, a lipophilic functional cosmetic active ingredient including sunscreens, or a mixture of such substances.

A lipophilic functional cosmetic active ingredient suitable for skin cosmetics, an active ingredient combination or an active ingredient extract is an ingredient or a mixture of ingredients that is approved for dermal or topical application. The following may be mentioned by way of example:

- 10 - active ingredients having a cleansing action on the skin surface and the hair. These include all substances that serve to cleanse the skin, such as oils, soaps, soapless detergents and solid substances;
- active ingredients having a deodorizing and perspiration-inhibiting action: they include antiperspirants based on aluminium or zinc salts, deodorants comprising bactericidal or bacteriostatic deodorizing substances, for example triclosan, hexachlorophene, alcohols and cationic substances, for example quaternary ammonium salts, and odour absorbers, for example <sup>®</sup>Grilocin (combination of zinc ricinoleate and various additives) or triethyl citrate, optionally in combination with an antioxidant, for example butyl hydroxytoluene) or ion-exchange resins;
- 15 - active ingredients that offer protection against sunlight (UV filters): suitable active ingredients are filter substances (sunscreens) that are able to absorb UV radiation from sunlight and convert it into heat. According to the desired action, the following light-protection agents are preferred: light-protection agents that selectively absorb sunburn-causing high-energy UV radiation in the range of approximately from 280 to 315 nm (UV-B absorbers) and transmit the longer-wave range of approximately from 315 to 400 nm (UV-A range), as well as light-protection agents that absorb only the longer-wave radiation of the UV-A range of from 315 to 400 nm (UV-A absorbers).
- 20 -
- 25 -

- 30 Suitable light-protection agents are, for example, organic UV absorbers from the class of the p-aminobenzoic acid derivatives, salicylic acid derivatives, benzophenone derivatives, dibenzoylmethane derivatives, diphenyl acrylate derivatives, benzofuran derivatives, polymeric UV absorbers comprising one or more organosilicon radicals, cinnamic acid derivatives, camphor derivatives, trianilino-s-triazine derivatives, phenylbenzimidazole sulfonic acid and salts thereof, menthyl anthranilates,

- benzotriazole derivatives, and/or an inorganic micropigment selected from aluminium oxide- or silicon dioxide-coated TiO<sub>2</sub>, zinc oxide or mica;
- active ingredients against insects (repellents): repellents are agents that are to prevent insects from touching the skin and becoming active there. They drive insects away and evaporate slowly. The most frequently used repellent is diethyl toluamide (DEET). Other common repellents will be found in "W. Raab and U. Kindl, "Pflegekosmetik", Gustav-Fischer-Verlag Stuttgart/New York, 1991, p. 161;
- 5 - active ingredients providing protection against chemical and mechanical influences: these include all substances that form a barrier between the skin and external harmful substances, for example paraffin oils, silicone oils, vegetable oils, PCL products and lanolin for protection against aqueous solutions, film-forming agents, such as sodium alginate, triethanolamine alginate, polyacrylates, polyvinyl alcohol or cellulose ethers against the effect of organic solvents, or substances based on mineral oils, vegetable oils or silicone oils as "lubricants" against severe mechanical stresses on the skin;
- 10 - moisturizing substances: the following substances, for example, are used as moisture-controlling agents (moisturizers): sodium lactate, urea, alcohols, sorbitol, glycerol, propylene glycol, collagen, elastin or hyaluronic acid;
- active ingredients having a keratoplastic effect: benzoyl peroxide, retinoic acid, colloidal sulfur and resorcinol;
- 15 - antimicrobial agents, for example triclosan or quaternary ammonium compounds;
- oily or oil-soluble vitamins or vitamin derivatives that can be applied dermally: for example vitamin A (retinol in the form of the free acid or derivatives thereof), panthenol, pantothenic acid, folic acid, and combinations thereof, vitamin E (tocopherol), F; essential fatty acids; or niacinamide (nicotinic acid amide);
- 20 - vitamin-based placenta extracts: active ingredient compositions comprising especially vitamins A, C, E, B<sub>21</sub>, B<sub>12</sub>, folic acid and biotin, amino acids and enzymes as well as compounds of the trace elements magnesium, silicon, phosphorus, calcium, manganese, iron or copper;
- skin repair complexes: obtainable from inactivated and disintegrated cultures of bacteria of the bifidus group;
- 25 - plants and plant extracts: for example arnica, aloe, beard lichen, ivy, stinging nettle, ginseng, henna, camomile, marigold, rosemary, sage, horsetail or thyme;

- animal extracts: for example royal jelly, propolis, proteins or thymus extracts;
- cosmetic oils that can be applied dermally: neutral oils of the Miglyol 812 type, apricot kernel oil, avocado oil, babassu oil, cottonseed oil, borage oil, thistle oil, groundnut oil, gamma-oryzanol, rosehip-seed oil, hemp oil, hazelnut oil, blackcurrant-seed oil, jojoba oil, cherry-stone oil, salmon oil, linseed oil, cornseed oil, macadamia nut oil, almond oil, evening primrose oil, mink oil, olive oil, pecan nut oil, peach kernel oil, pistachio nut oil, rape oil, rice-seed oil, castor oil, safflower oil, sesame oil, soybean oil, sunflower oil, tea tree oil, grapeseed oil or wheatgerm oil.

5           The preparations in stick form are preferably anhydrous but may in certain cases comprise a  
10          certain amount of water which, however, in general does not exceed 40 % by weight, based  
              on the total weight of the cosmetic preparation.

If the cosmetic preparations and formulations according to the invention are in the form of  
semi-solid products, that is to say in the form of ointments or creams, they may likewise be  
15          anhydrous or aqueous. Such preparations and formulations are, for example, mascaras,  
eyeliners, foundations, make-up for the cheeks, eyeshadows, or compositions for treating  
rings under the eyes.

If, on the other hand, such ointments or creams are aqueous, they are especially emulsions  
of the water-in-oil type or of the oil-in-water type that comprise, apart from the pigment, from  
20          1 to 98.8 % by weight of the fatty phase, from 1 to 98.8 % by weight of the aqueous phase  
              and from 0.2 to 30 % by weight of an emulsifier.

Such ointments and creams may also comprise further conventional additives, for example  
perfumes, antioxidants, preservatives, gel-forming agents, UV filters, colourants, pigments,  
25          pearlescent agents, undyed polymers as well as inorganic or organic fillers.

If the preparations are in the form of a powder, they consist essentially of a mineral or  
inorganic or organic filler, for example, talc, zinc stearate, mica, kaolin, nylon powders (in  
particular Orgasol), polyethylene powders, Teflon, starch, boron nitride, microspheres of  
30          copolymers, such as Expancel (Nobel Industrie), Polytrap (Dow Corning), silicone resin  
              microbeads (Tospearl from Toshiba, for example), polyethylene powder or polyamide  
              powder, as well as adjuvants such as binders, colourants, etc..

The fillers may be present in an amount ranging from 0 to 35% of the total weight of the composition, preferably from 0.5 to 15%.

Such preparations may likewise comprise various adjuvants conventionally employed in cosmetics, such as perfumes, antioxidants, preservatives, etc..

5

If the cosmetic preparations and formulations according to the invention are nail varnishes, they consist essentially of nitrocellulose and a natural or synthetic polymer in the form of a solution in a solvent system, it being possible for the solution to comprise other adjuvants, for example pearlescent agents.

10

In that embodiment, the dyed polymer is present in an amount of approximately from 0.1 to 5 % by weight.

15 The cosmetic preparations and formulations according to the invention may also be used for colouring the hair, in which case they are used in the form of shampoos, creams or gels that are composed of the basic substances conventionally employed in the cosmetics industry and comprise at least one pigment of formula as defined above.

20 The cosmetic preparations and formulations according to the invention are prepared in the conventional manner, for example by mixing or stirring the components together, optionally with heating, so that the mixtures melt.

The composition examples below are given by way of illustration and without a limiting nature.

25 The Examples which follow serve to illustrate the invention without limiting it thereto. Parts are parts by weight and percentages are percentages by weight. Temperatures are given in degrees Celsius.

30 The pigments of formula (Ia) as defined in Table 1 are used for the following formulation examples.
